

Technician Workshop

March 25, 2010

Marriott
2101 Louisiana Blvd, NE
Albuquerque, NM 87110

The purpose of these workshops is to provide a venue for technicians to identify sources of variation and best practices in asphalt binder test methods. A detailed set of recommended improvements to current procedures will be developed and shared amongst workshop participants and RMAUPG/WCTG Members. Significant ambiguities have been submitted to AASHTO from previous workshops and have been included in updated revisions to AASHTO Standards. Technicians will participate in an open, symposium format with discussion encouraged. This year's workshop will focus on the DSR including MSCR testing, Rotational Viscosity, and Penetration tests. DSR Manufacturers have graciously agreed to have equipment present for discussion purposes and open forum questions. We also have a speaker scheduled to provide a brief overview of the data generated from the MSCR, what it means and how to analyze it.

For additional information please call 303-471-6286.
